AI Artifact

In T2I tasks, an AI artifact is the still image a model generates from a text prompt. Two such images from the same prompt are shown side by side — your job is to rate each one on four axes. One of those axes, **Absence of AI Artifacts**, has a specific scope: it covers generation tells visible in the image, not every quality issue.

Understanding this scope is what separates a calibrated rater from one who double-penalizes.

Why it's its own axis

An image can be technically sharp, well-composed, and beautifully lit — and still contain serious artifacts. The reverse is also true: an image can have one bad hand and otherwise be excellent. If you treat artifacts as a general quality problem, you'll count the same flaw twice: once on AI Artifacts and again on Visual Quality. That inflates the penalty beyond what the defect actually warrants.

AI Artifacts vs. Visual Quality

AI Artifacts are local, generation-specific tells — bad fingers, garbled text, tiling, floating objects. **Visual Quality** judges the whole image — sharpness, composition, lighting. A single bad hand is an AI Artifacts finding. Only lower Visual Quality when the whole image looks soft, blurry, or washed out.

Four classes to check on every T2I image

Check each class in order on both images before you score.

- Anatomy failures
- Texture problems
- Text rendering
- Object and scene inconsistencies

Operational test

Ask one question for each element you inspect:

"Is what I see explained by the prompt, or does it look like the model failed to generate it correctly?"

A shadow falling the wrong way is a generation failure. A blurry background in a shallow-focus portrait is composition — that's Visual Quality. Text that looks like it belongs to a different language than the prompt requested is an artifact. Text that's readable but in a different font than you'd prefer is an aesthetic call, not an artifact.

Scope: T2I only

This axis applies to T2I comparison tasks only. The fellow receives two still images from the same prompt and scores each across Overall Preference, Instruction Following, Visual Quality, and Absence of AI Artifacts.

For generation defects in video tasks, see [Artifact patterns](#). For audio artifacts, see [Audio artifacts](#).
